Database

Amazon DynamoDB

A fast and flexible NoSQL database service for any scale

DynamoDB is a fully managed, key-value, and document database that delivers single-digit millisecond performance at any scale.

Get started

Create a new table to start exploring DynamoDB.

[Create table](#)

Pricing

DynamoDB charges for reading, writing, and storing data in your DynamoDB tables, along with any optional features you choose to turn on. DynamoDB has on-demand capacity mode and provisioned capacity mode, and these modes have pricing for processing reads and writes on your tables.

Create table

Table details [info](#)

DynamoDB is a schemaleless database that requires only a table name and a primary key when you create the table.

Table name
This will be used to identify your table.

Between 3 and 255 characters, containing only letters, numbers, underscores (_), hyphens (-), and periods (.).

Partition key
The partition key is part of the table's primary key. It is a hash value that is used to retrieve items from your table and allocate data across hosts for scalability and availability.

String

1 to 255 characters and case sensitive.

Sort key - optional
You can use a sort key as the second part of a table's primary key. The sort key allows you to sort or search among all items sharing the same partition key.

String

1 to 255 characters and case sensitive.

Table settings

☒ **Default settings:**
The fastest way to create your table. You can modify most of these settings after your table has been created. To modify these settings now, choose **Customize settings**.

☐ **Customize settings:**
Use these advanced features to make DynamoDB work better for your needs.

Default table settings
These are the default settings for your new table. You can change some of these settings after creating the table.

In JSON view, we can modify the data

The screenshot displays the AWS Lambda console interface. At the top, there's a navigation bar with the AWS logo and the text 'Functions'. Below this, a left sidebar contains a 'Dashboard' section with links to 'Applications', 'Functions', and 'Additional resources'. The main content area features a blue header with the text 'Introducing the AWS Serverless generative AI workshop series' and a 'Create function' button. Below the header, there's a section titled 'Functions (5)' with a search bar. A table lists five functions: 'MainMonitoringFunction', 'RuleCreationFunction', 'RedshiftEventSubscription', 'MainLabRole', and 'RedshiftOpsWatch'. Each function entry includes a checkbox, a description, a package type (Zip), a runtime (Python 3.10), a type (Standard), and a last modified date (2 months ago).

Function name	Description	Package type	Runtime	Type	Last modified
MainMonitoringFunction	-	Zip	Python 3.10	Standard	2 months ago
RuleCreationFunction	Create SQR if absent	Zip	Python 3.10	Standard	2 months ago
RedshiftEventSubscription	Create Redshift event subscription to SNS Topic	Zip	Python 3.10	Standard	2 months ago
MainLabRole	updates LabRole to allow it to assume itself	Zip	Python 3.10	Standard	2 months ago
RedshiftOpsWatch	Deletes Redshift Cluster if the count is more than 2.	Zip	Python 3.10	Standard	2 months ago

Architecture Info
Choose the instruction set architecture you want for your function code.

☐ arm64
☒ x86_64

Permissions Info
By default, Lambda will create an execution role with permissions to upload logs to Amazon CloudWatch Logs. You can customize this default role later when adding triggers.

▼ Change default execution role
Execution role
To access other AWS services and resources your function needs an IAM role. Choose a role with the right permissions for your function.

☐ Create default role
☒ Use another role

LabRole

Create new role

[View role details in IAM](#)

► Additional configurations
Use additional configurations to set up networking, security, and governance for your function. These settings help secure and customize your Lambda function deployment.

Go to S3

Create a bucket, ACLs enabled

Enable bucket versioning

Deploy and test, Copy another code

Add trigger

}

Now go to DynamoDB , explore items->It will reflect in DynamoDB also

It will display the object details

Now delete the uploaded object in S3

Launch A...igws | V...Edit item...Lambda...Items | A...Lambda...S3 bucke...Installing...What...Add Trig...+
